Markdown

Power at your fingertips

Thomas de Graaff

August 23, 2016

Recap

Our main goal:

> *To make our research as reproducable and visible as possible*

This entails:

1. Sharing of code
2. Sharing of data (if possible and not proprietary nor privacy sensitive)
3. Sharing of output (presentation, article, website)

The power of plain text

1. Ubiquitous
2. Usually small in size
3. Portable across platforms (and versions)
    - it will not be obsolete soon
    - *everyone* can read it *everywhere*
4. It is scriptable (both as input as output)
    - code is almost **always** in text format
    - **usually** data is in text format as well
    - but underlying format for output (presentation, website, tables, articles, books) **can** be text as well

Manipulation of text

- Most output is based on simple text file; applications only change appearance, such as:
  - browsers
  - pdf
- **How** to change appearance require markup-languages
  - `HTML`
  - `LaTeX`
  - `Markdown`

Why markdown?

1. Easy to learn
   `http://daringfireball.net/projects/markdown/`
2. Much less notation than LaTeX. Originally,
   - `LaTeX` is for paper (aka dead trees)
   - `Markdown` is for `HTML` (blogs, wikipedia and so)
   - but sneakily uses some LaTeX when needed
3. Focus on text
4. Nowadays:
   - "easily" change it in `html` or `pdf` (via LaTeX)—even in Word's `.docx` if needed (but error prone)
   - can be extended with code (verbatim) or—even better—its results

Small diversion

Question 1: Why and when do we make use of `pdf`'s and not `html`?

Question 2: Is one always better than the other?

Language syntax

Emphasis:

```
*italic* **bold**
_italic_ __bold__
```

Headers:

```
# Header 1
## Header 2
### Header 3
```

Language syntax (cont.)

Unordened lists

```
* Item 1
* Item 2
    + Item 2a
    + Item 2b
```

Ordered List

```
1. Item 1
2. Item 2
3. Item 3
    + Item 3a
    + Item 3b
```

Language syntax (cont.)

Links: Cheatsheet

```
[Cheatsheet](http://assemble.io/docs/Cheatsheet-Markdown.ht
```

Images:

```
![alt text](http://example.com/logo.png)
![alt text](figures/img.png)
```

footnotes:

As it is well known[1]

```
As it is well known[^fn1]
[^fn1]: You know nothing, John Snow
```

[1] You know nothing, John Snow

Language syntax (cont.)

Code blocks:

````
```python
s = "Python syntax highlighting"
print s
```
````

which renders as:

```python
s = "Python syntax highlighting"
print s
```

Language syntax (cont.)

To embed mathematics 'just' use LaTeX (see **here** for list of symbols and note that LaTeX should be installed on your computer):

```
$$e=mc^2$$
```

which surprisingly looks as excel type of formulae and renders as:

$$e = mc^2$$

Language syntax (cont.)

Inline equations just require $ $, e.g.:

```
In economics it is well known that:
$\frac{d x}{d y} = -\frac{
\partial u(x,y)/ \partial y} {
\partial u(x,y)/ \partial x}$.
```

which renders as

In economics it is well known that: $\frac{dx}{dy} = -\frac{\partial u(x,y)/\partial y}{\partial u(x,y)/\partial x}$.

The swiss knife of formats

So how do we glue everything together and produce wonderful `html`s and `pdf`s out of thin air? With **pandoc**

- Pandoc can convert from (not extensive):
  - `Markdown` (whoohoo), `LaTeX`, `HTML`, `DocBook`, `Org`-mode, and ... Words `docx` (sort off)
- To (and here we go...)
  - HTML formats (including those very cool and nerdy HTML(5) slides)
  - via Latex to pdf
  - Word (but support somewhat limited) and OpenOffice formats
  - various markup formats
  - and much more

The assignment

- if not already done do:
  - clone `thdegraaff/ERSA-WooW` and save it locally
- go to the folder `./Assignments/`
- Open `Assignment1.md` in `RStudio`
- and transform `Assignment1.md` *as much as possible* in `RStudio`:
  - This means adding Markdown tags to the basic text
  - The file HowToWriteAShinyPaperLimited provides a `LaTeX` example how the format sort of should be.
- Save it with the same name.
